

OMEGA REV series

170÷1570 kW

General

Water-condensed liquid chiller for interior applications featuring semi-hermetic screw compressors, a shell-and-tube condenser and a dry-expansion shell-and-tube evaporator.

Configurations

HE: high efficiency chiller

OH: non-reversible heat pump

HPW: reversible heat pump on water side

HWT: unit for production of high temperature water

LC: condenserless unit

DS: unit with desuperheaters

DC: unit with recovery condenser

LN: low noise unit

SLN: super low noise unit

Strengths

- ▶ HE option in Eurovent Class A
- ▶ HWT option for the production of hot water up to 63°C
- ▶ Reduced refrigerant charge
- ▶ RS485 serial port and Ethernet as standard
- ▶ Integrated web server
- ▶ Multilogic function

SPECIFICATIONS

Water-condensed liquid chiller for interior applications featuring semi-hermetic screw compressors, a shell-and-tube condenser and a dry-expansion shell-and-tube evaporator.

Refrigerant R134a

STRUCTURE

Consisting of hot dip galvanised steel sections and painted with polyester powder coating (RAL 9005).

The electrical control panel consists of a hot dip galvanised steel box, painted with polyester powder coating (RAL 7035).

COMPRESSORS

Semi-hermetic screw compressors with continuous capacity reduction of output power by 25 up to 100%, which allows the energy efficiency of the unit to be maximized in all operating conditions.

The capacity reduction of the entire unit is always continuous, from the minimum capacity reduction step, based on the number of compressors, up to 100%.

Lubrication of the compressors is ensured by the pressure difference between delivery and suction.

All the compressors are fitted with check valve on delivery side, metal mesh filter on suction side and electronic protection with temperature sensors directly inserted in the windings and on the delivery pipe.

The machine is started and switched off with a forced 25% capacity reduction of each compressor and starting is of the "star-delta" type.

All the compressors are standardly supplied with a crankcase heater and a delivery valve. They are installed on anti-vibration mounts in order to reduce vibration transfer to the structure.

SOURCE-SIDE HEAT EXCHANGER

Flooded type, shell-and-tube condenser featuring water flow on the tube side and refrigerant flow on the shell side. Steel shell and shell-and-tube made of copper tubing

The heads can be removed for tube inspection and cleaning.

Victaulic type couplings on the water side (complete with nipple for connection)

USER-SIDE HEAT EXCHANGER

The exchanger is a dry-expansion shell-and-tube exchanger. It is sized to maximize the efficiency of the unit, by keeping the overall dimensions and the refrigerant charge down to a minimum.

The exchanger consists of a steel shell insulated with a shell made of closed-cell foam material, while the tube bundle is made with copper tubes.

The heads can be removed for tube inspection and cleaning. Victaulic type couplings on the water side (complete with nipple for connection)

On the hydraulic connections of the heat exchanger, there are also pipe taps for the differential pressure switch, and wells for the temperature probes.

REFRIGERANT CIRCUIT

Each refrigerant circuit of the unit comprises:

- a delivery valve for each compressor;
- a shut-off valve in the liquid line;
- charging valves;
- a liquid sight glass;
- a replaceable solid cartridge dehydrator filter;
- an electronic expansion valve;
- pressure transducers for reading the high and low pressure values and relevant evaporating and condensing temperatures;
- a high pressure switch;
- a safety valve.

The pipes of the refrigerant circuit and the heat exchanger on the user side are insulated with extruded closed-cell expanded elastomer.

Compared to the mechanical expansion valve, the electronic expansion valve allows machine stability to be reached more quickly and better superheating control to maximize the use of the evaporator in all load conditions. This also acts as shut-off valve on the liquid line, as it closes during compressor stops, so preventing dangerous refrigerant migration.

ELECTRICAL CONTROL PANEL

The electrical control panel consists of a galvanized and painted sheet-iron box with forced ventilation and IP21 protection rating. The electrical control panel of the basic unit comprises:

- a main disconnect switch;
- fuses to protect the compressors and the auxiliary circuits;
- compressor contactors;
- a phase monitor;
- potential-free general alarm contacts;
- single potential free operating contacts;
- a microprocessor control with display accessible from the outside;
- a capacitive backup battery for electronic expansion valve.

All the electrical cables inside the panel are numbered and the terminal board dedicated to the customer's connections is coloured blue so that it can be quickly identified in the panel.

All models must be powered with 400V/3~/50Hz.

CONTROL

The microprocessor control allows the following functions:

- water temperature regulation, with outgoing water control;
- freeze protection;
- compressor timings;
- automatic rotation of compressor starting sequence;
- display of alarms;
- management of capacity reduction of the compressors during starting, switching off and load tracking;

- management of capacity reduction of the compressors in the event of operation outside the limits;
- recording of the log of the main variables;
- recording of the alarm log;
- sliding defrost management;
- RS485 serial port with Modbus protocol;
- Ethernet serial port with Modbus protocol and integrated WEB server;
- digital input for remote ON/OFF;
- digital input for Summer/Winter mode selection (only in HPW versions);
- digital input for selection of double set point.

The control has a graphic display that allows the following information to be displayed:

- water input and output temperature;
- set temperature and differential set points;
- description of alarms;
- hours of operation on the hour meter and number of start-ups of the unit and compressors;
- high and low pressure values, and relevant condensing and evaporating temperatures;
- superheating at compressor suction.

For further details on available functions and on displayed information, you can refer to the specific documentation of the control.

By default, the serial connections present as standard are enabled only for reading from BMS. Enabling of writing from BMS is to be requested when ordering.

CONTROLS AND SAFETY DEVICES

All the units are fitted with the following control and safety components:

- double high pressure switch with manual reset for each compressor;
- high pressure safety device with automatic reset and limited interventions managed by the control via specific pressure transducer;
- low pressure safety device with automatic reset and limited interventions managed by the control via specific pressure transducer;
- high pressure safety valve;
- operation probe at the outlet of the user-side heat exchanger that also acts as antifreeze probe;
- thermal overload protection for compressors;
- water differential pressure switch installed at the factory.

TESTING

All the units are factory-tested and supplied complete with oil and refrigerant.

VERSIONS

Other different versions are available to complete the OMEGA REV base line.

HE: high efficiency unit

The HE version unit uses oversized heat exchangers in order to increase the ratio between the exchange surfaces and the compressor capacity. This allows all models to achieve Eurovent Class A for EER and consequently also high ESEER values.

OH: non-reversible heat pump

This non-reversible heat pump is ideal for all applications in which the user does not need to produce cold water.

HPW: reversible heat pump on water side

This water-side reversible heat pump is ideal for applications in which it is possible to switch from the user to the source circuit and vice versa. To make this option possible, the fitter must simply make provision for a system of valves in order to implement switching from one circuit to the other.

When the switching from one season to the other is implemented via remote or BMS signal, the unit can control motor-driven reversing valves (not supplied) so as to make this operation fully automatic.

LC: condenserless unit

In this version the unit does not fit the water-fed heat exchanger on the source side as it can be connected to a remote condenser.

The unit is supplied as follows:

- with solenoid valves on the liquid line;
- with weld-on refrigerant connections closed with copper plugs;
- without the refrigerant load, and loaded with nitrogen.

/HWT: unit for production of high temperature water

Units with /HWT option use compressors with oversize electric motor for production of water at high temperature. This option is available for OH and HPW units or for cold only units with /DC option.

/LN: low noise unit

In this version the unit features a soundproof casing on the compressor, which consists of an outer rigid hood that is made with galvanised metal sheet and painted (RAL 7035), and whose interior is lined with a noise-absorbing matting and high noise impedance material in between.

/SLN: super low noise unit

In this version the unit comprises:

- a soundproof casing on the compressor, which consists of an outer rigid hood that is made with galvanised metal sheet and painted (RAL 7035), and whose interior is lined with a noise-absorbing matting and high noise impedance material in between;

soundproofing of the delivery and suction piping of the compressor by means of noise-absorbing insulating material and high noise impedance material.

OPTIONS

/DC: unit with recovery condenser

In addition to the set-up of a chiller only unit, /DC units comprise:

- a recovery condenser for recovering 100% of the condensation heat on each refrigerant circuit;
- a temperature probe at the inlet of each recovery exchanger;
- potential free contact in the electrical control panel for activation of recovery.

When required by the system, through the closing of a contact, the control automatically manages activation of recovery. Recovery management is carried out through a control on the temperature of the return water. The control also automatically manages safety deactivation of recovery, if the condensing pressure becomes too high, and switches to using the source-side heat exchanger.

/DS: unit with desuperheater

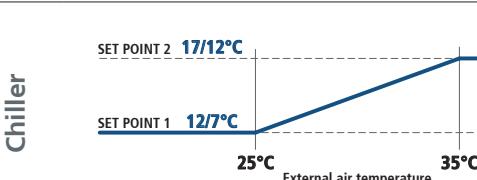

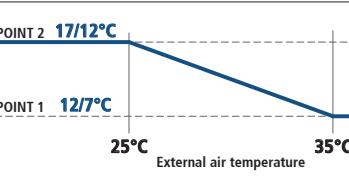

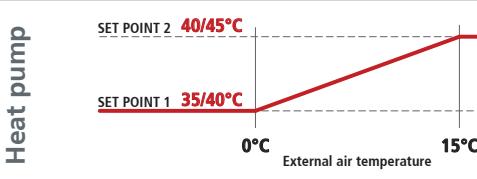

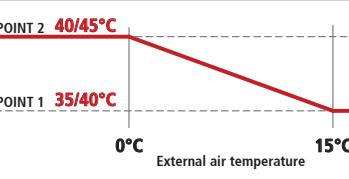

In addition to the chiller only version, /DS units feature (for each refrigerant circuit) an exchanger for the recovery of heat that forms during superheating, placed in series with the source-side exchanger.

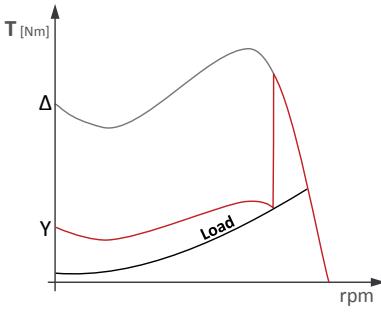

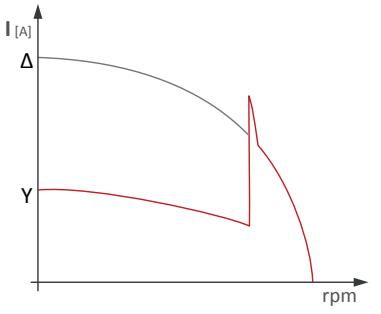

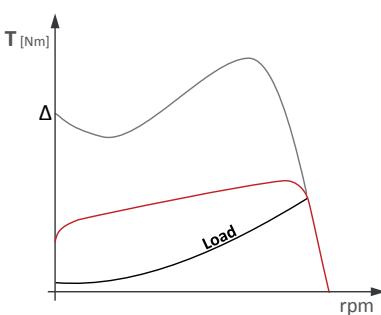

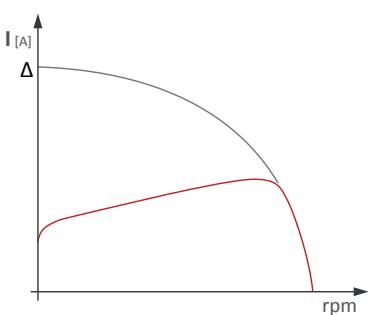

/HWT: unit for high temperatures of produced water

Units with /HWT option use compressors with oversize electric motor for production of water at high temperature. This option is available for /OH and /HPW units or for cold only units with /DC option.

DESCRIPTION OF ACCESSORIES

CODE	Accessory	Operation and advantages
REFRIGERANT CIRCUIT ACCESSORIES		
SCR	0-10V signal for remote condensation control	This accessory requires provision of an analog input for a 0-10V circuit in the terminal board in order to check condensation using a modulating component, such as a valve or an inverter.
MAFR	Pressure gauges	The operating pressures of each circuit of the unit can be displayed on the control by accessing the relevant screens. Also, the machine can be fitted with pressure gauges (two for each circuit) installed in a clearly visible position. These allow reading in real time of the working pressures of the refrigerant gas on the low pressure side and on the high pressure side of each refrigerant circuit.
RIC	Liquid receivers	The adoption of this accessory always guarantees correct feeding of the expansion valve even when the unit is subjected to wide external air temperature ranges. This accessory is standard on LC/DC units.
RUBA	Compressor suction valves	The valves situated on the suction side of the compressors allow the compressor to be isolated from the rest of the refrigerant circuit, so making the maintenance operations quicker and less invasive.
DVS	Double safety valve	With this accessory, instead of each individual safety valve per circuit, there is a "candelabrum" with two safety valves and a diverter valve for choosing the valve in operation. This allows the safety valves to be replaced without having to drain the machine and without having to stop it.
VS	Liquid line solenoid valve	This accessory prevents refrigerant migration that could damage the compressor on starting. Standard on HP units.
BK	Brine Kit	Application of this accessory is compulsory if the unit has to produce water with temperature lower than +3°C (if the unit is provided with double set point or variable set point, the lower set point is considered). The accessory consists of adopting an increased insulation and a suitable sizing and calibration of some components.

CODE	Accessory	Operation and advantages
ELECTRICAL ACCESSORIES		
PBA	BACnet protocol over IP (Ethernet)	The control is set for using the BACnet protocol (instead of Modbus) on the Ethernet port. By default, the programming gives read-only access to the control of the unit. Enabling of read/write access should be requested when ordering.
GLO	Lon Gateway	With this accessory, a RS485/Lon gateway is installed inside the electrical control panel. By default, the programming gives read-only access to the control of the unit. Enabling of read/write access should be requested when ordering.
FM2	Multilogic function for Master unit for managing up to 2 Slaves	With this accessory, the unit is programmed as master of a system of machines in Multilogic network (for further details, refer to the control manual). Also, a network gateway with 4 ports is installed in the electrical control panel of the unit to allow the unit to be connected to an external LAN network and up to 2 slave units to be managed.
FM6	Multilogic function for Master unit for managing up to 6 Slaves	With this accessory, the unit is programmed as master of a system of machines in Multilogic network (for further details, refer to the control manual). Also, a network gateway with 8 ports is installed in the electrical control panel of the unit to allow the unit to be connected to an external LAN network and up to 6 slave units to be managed.
FMO	Multilogic function for Slave unit	With this accessory, the unit is programmed as slave of a system of machines in Multilogic network (for further details, refer to the control manual).
LID	Limitation of the current absorbed by digital input	When this accessory is requested, a digital input is prepared in the terminal board to activate the forced capacity reduction of the unit to a set fixed level. This accessory is useful when there is a need to necessarily limit the power absorbed by the unit as regards particular conditions.
LIRA	Absorbed current limitation with measurement of absorption	For the unit equipped with this accessory, it is possible to set, directly in the control, a maximum current that can be absorbed by the machine. The control instantly checks the absorptions, through an amperometric transformer, and, in case of need, applies a dynamic forced capacity reduction able to always keep the absorbed current below the set threshold.
RIF	Power factor correction to $\cos\varphi \geq 0.9$	With this accessory, an electrical control panel, containing power factor correction condensers to bring the $\cos\varphi$ of the unit to being greater than 0.9, is supplied with the unit. The condensers should be connected (by the customer) to the electrical control panel of the unit in the specially prepared terminal board. Besides reducing the absorbed reactive power, the use of this accessory also allows the maximum absorbed current to be lowered.
SETD	Double set point from digital input	For units fitted with this accessory, it is possible to preset two different operating set points and manage the change from one to the other through a digital signal. The set point temperatures must be specified when ordering.
SETV	Variable set point with remote signal (0-1V, 0-10V, 4-20mA)	For units fitted with this accessory, the set point can be varied continuously between two preset values, a maximum and a minimum, depending on an external signal that can be of the 0-1V, 0-10V or 4-20mA type.
CSP	Set point compensation depending on external air temperature	<p>For units fitted with this accessory, the set point of the unit is set so that it can vary between two values, a maximum and a minimum, depending on the external air temperature. The compensation ramp and the maximum and minimum values of the set point can be changed by the user.</p> <p>Unless otherwise specified in the order, the control will be set to implement a negative compensation logic according to the temperatures shown in the following diagrams:</p> <div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p>Negative compensation</p>  </div> <div style="text-align: center;"> <p>Positive compensation</p>  </div> </div> <div style="display: flex; justify-content: space-around; margin-top: 20px;"> <div style="text-align: center;"> <p>Negative compensation</p>  </div> <div style="text-align: center;"> <p>Positive compensation</p>  </div> </div> <p>The temperature probe detecting external air is included in the standard supply, but it must be installed by the customer.</p>

CODE	Accessory	Operation and advantages
<p>Screw compressors are switched on using star-delta starting since this method allows very small effective average inrush currents to be obtained, but, as can be seen in the following diagrams, the connection change generates current peaks lasting for a few ms.</p>		
		 
SOFT	Electronic soft-starter	<p>If the unit is equipped with the electronic soft-starter accessory, the starting of each compressor becomes of the DOL (Direct On Line) type, but with an acceleration ramp that allows the peaks of the star-delta system to be eliminated.</p>
		 
<p>TERM</p>  <p>Remote-controlled user terminal</p> <p>This accessory allows the terminal normally situated on the machine to be replicated on a support situated at a distance. It is particularly suitable when the unit is placed in an area that is not easily accessible.</p> <p>The accessory is supplied with the unit and is to be installed by the customer at a maximum distance of 120m from the unit.</p>		
DAM	Double power supply with manual switching	A manual switch to which to connect two separate power supply lines (for example, one from the mains power line and one from the uninterruptible power supply unit) is installed in the electrical control panel of the unit. The switching from one line to another is manual and compulsorily requires passing through the OFF position.
DAA	Double power supply with automatic switching	A motor-driven automatic switch to which to connect two separate power supply lines (for example, one from the mains power line and one from the uninterruptible power supply unit) is installed in the electrical control panel of the unit. The switching from one line to another is automatic and compulsorily requires passing through the OFF position.
RMMT	Maximum and minimum voltage relay	This accessory constantly monitors the voltage value and the unit's power supply phase sequence. If the supply voltage does not fall within the set parameters or there is a phase reversal, an alarm is generated that stops the machine to prevent damage to its main parts
IA	Automatic circuit breakers	With this accessory, automatic circuit breakers are installed instead of fuses for the protection of auxiliary loads. Also, the same accessory uses automatic circuit breakers with adjustable thermal overload protection to protect the compressors.
Relay for management of 1 external pump		This accessory can be requested for units without pumps and allows a pump outside the machine to be controlled.
Relay for management of 2 external pumps		This accessory can be requested for units without pumps and allows two pumps outside the machine to be controlled with a running/stand-by logic by implementing a rotation on the hours of operation.

CODE	Accessory	Operation and advantages
OTHER ACCESSORIES		
AG	Rubber anti-vibration mounts	These allow you to reduce the vibrations transmitted from the unit to the surface it is standing on. Accessory supplied with the unit.
AM	Spring anti-vibration mounts	These allow you to reduce the vibrations transmitted from the unit to the surface it is standing on. Accessory supplied with the unit.
PREA	Partially assembled construction	The unit is delivered so that it can be disassembled easily on site if this makes the installation operations easier. A unit requested with this option is supplied: <ul style="list-style-type: none"> • screwed instead of riveted • with plugged and not welded pipes • without refrigerant charge • untested • covered by the warranty only if reassembled and screwed together by personnel authorized by the factory
GABB	Packaging in wooden crate	The unit is enclosed in a treated and ISPM 15 marked wooden crate. This accessory is strongly advised for shipping by container.
FLUS	Flow switch (instead of the water differential pressure switch)	As an alternative to the differential pressure switch (standard flow sensor), it is possible to request the paddle flow switch as accessory. This detects when there is no water flow to the user-side exchanger and sends a signal to the control of the unit that will stop the compressors to prevent damage to the exchangers. The flow switch is supplied with the unit (installation by the customer) and replaces the water differential pressure switch (standard).
FW	Water filter	To protect the elements of the hydraulic circuit (in particular, the exchangers), there are Y filters that can stop and settle the particles that are normally present in the water flow and would otherwise settle in the more delicate parts of the hydraulic circuit and damage its heat exchange capacity. Installation of the water filter is mandatory even when it is not supplied as an accessory. Accessory supplied with the unit.

OPERATING LIMITS - OMEGA REV - OMEGA REV HE

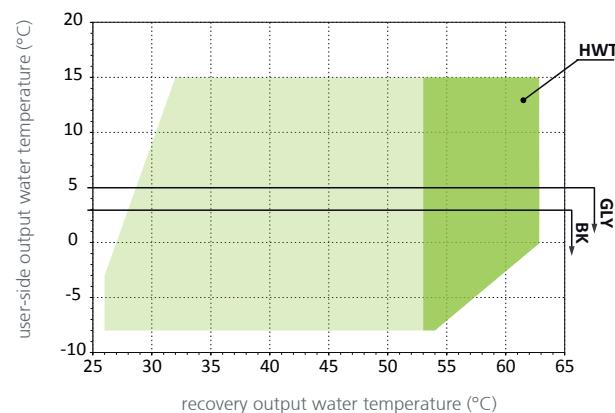

COOLING

HEATING

RECOVERY

ADMISSIBLE THERMAL GRADIENTS

The indicated limits refer to the temperature deltas (ΔT) allowed by the max. and min. flow rate values of the heat exchangers.

KEY TO SYMBOLS

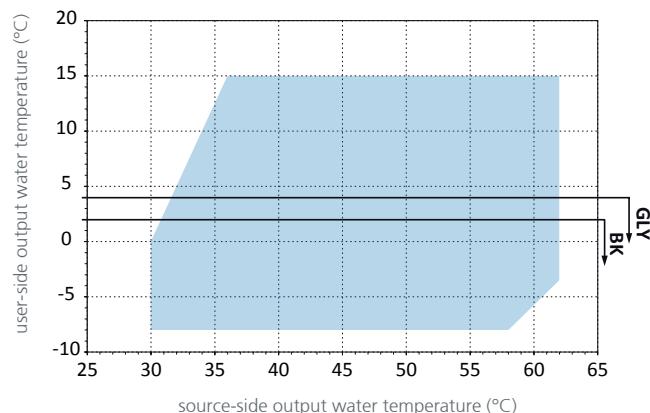

GLY (GLYcol): for SET point temperatures below 5°C, it is mandatory to use suitable percentages of antifreeze additives (glycols) to prevent ice formation in the exchanger.

BK (Brine Kit): for SET point temperatures below 3°C, it is mandatory to use the "Brine Kit" accessory.

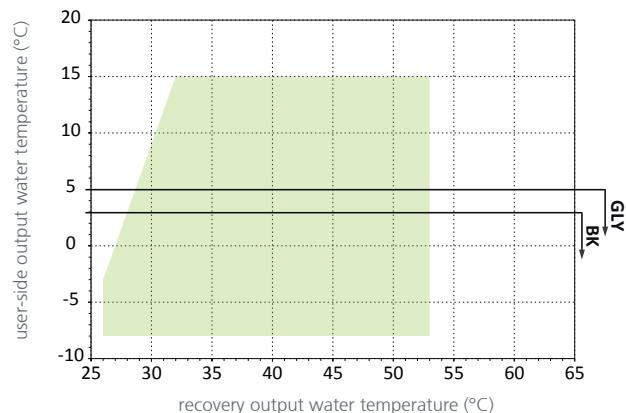

HWT (High Water Temperature): operating limits applying to "heating only" mode.

Values applying at the following conditions: temperature of input/output water to/from source side 30/35°C; temperature of input/output water to/from user side 12/7°C.
Lw: sound power value based on measurements made in accordance with ISO 3744 and the Eurovent certification programme. This certification refers specifically to the sound power level in dB(A). This is therefore the only acoustic reading to be considered binding.
Lp: mean sound pressure level, measured at 1 metre from the unit, in free field on a reflecting surface. Non binding value obtained from the sound power level

153.3	77	57	76	56	80	60	78	58	88	68	85	65	80	60	69	49	91	71

Values applying at the following conditions: temperature of input/output water to/from source side 30/35°C; temperature of input/output water to/from user side 12/7°C.
Lw: sound power value based on measurements made in accordance with ISO 3744 and the Eurovent certification programme. This certification refers specifically to the sound power level in dB(A). This is therefore the only acoustic reading to be considered binding.
Lp: mean sound pressure level, measured at 1 metre from the unit, in free field on a reflecting surface. Non binding value obtained from the sound power level
